Count tables

For each slide, there are two tables, one for up to 500 um below DEJ and one for up to 1000 um below DEJ.

	Counts				Density				Regularized Density			
	normal		lesion		normal		lesion		normal		lesion	
	epi	dermis	epi	dermis	epi	dermis	epi	dermis	epi	dermis	epi	dermis
CD11c	18	1372	0	0	90	1575			92	1329		
CD123	15	1353	0	0	75	1553			76	1266		
CD15	2	195	0	0	10	223			10	209		
CD279	69	1453	0	0	348	1668			354	1669		
CD3	187	4071	0	0	944	4673			959	4470

Table 60: SK3_Les. All measurements are up to 500 um below DEJ. Area is measured in mm2. Density in count per mm2. Regularized density refers to the average of positive density measurements taken at 100um DEJ depth intervals, i.e. each depth is weighted equally instead of based on tissue shape.

Figures

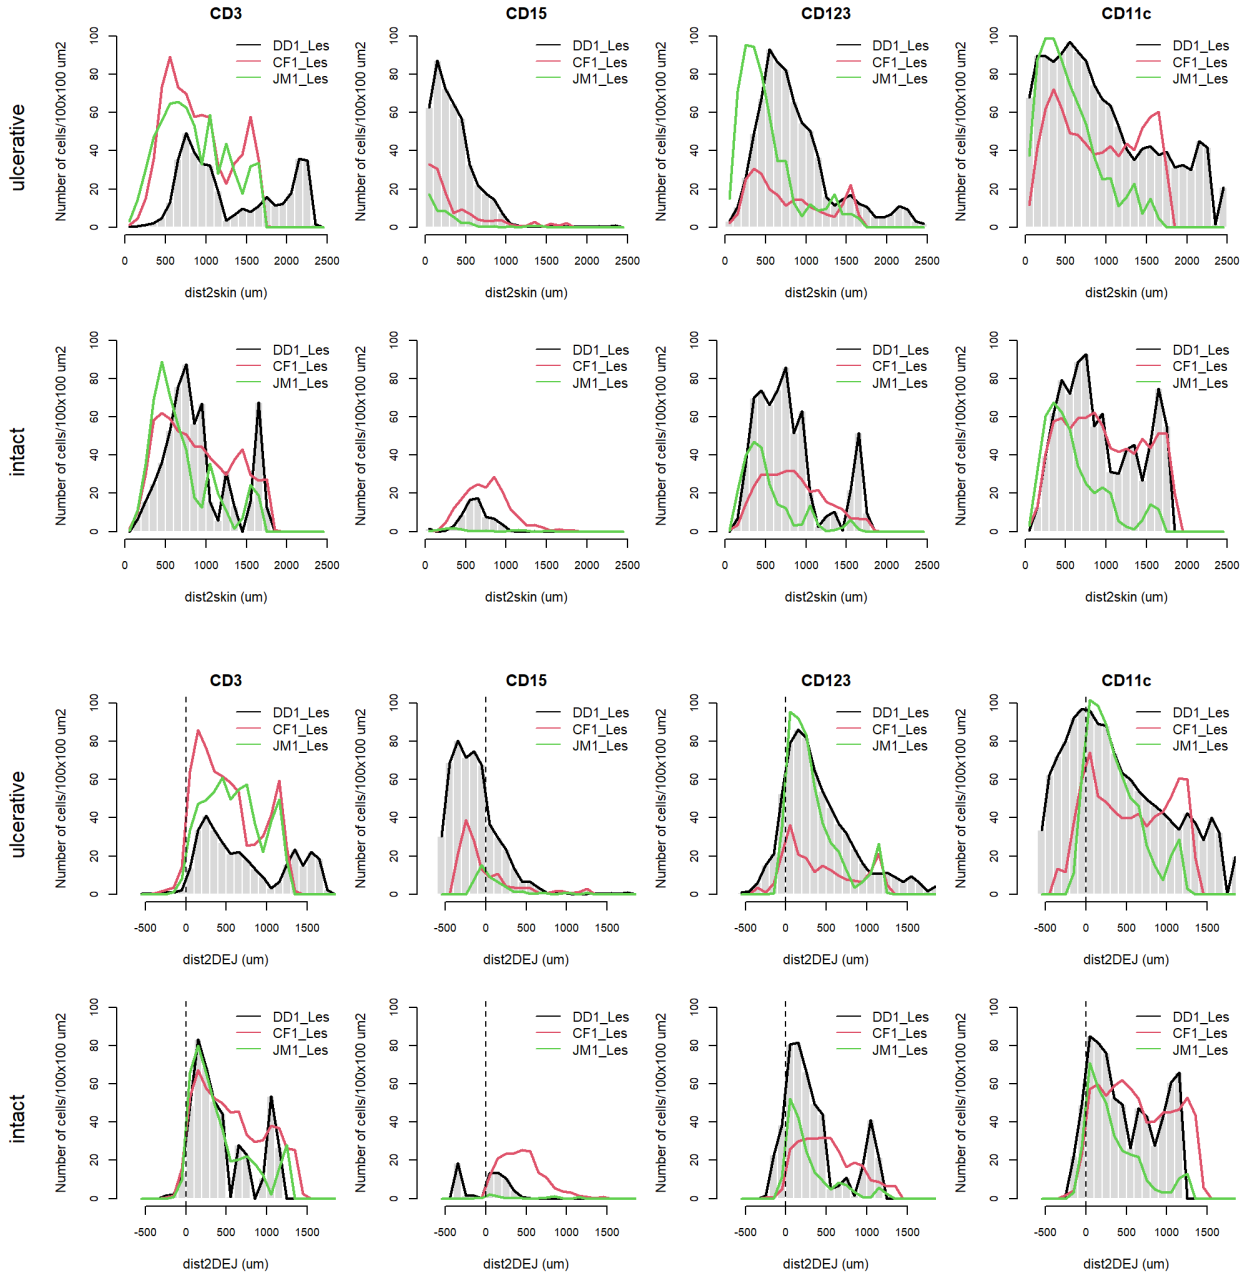

Figure 1: Number of cells per 100x100 um2 tissue as a function of distance to DEJ or skin. The curves are smoothed over histograms and each bin in the histogram represents a 100 um interval. Adding up the counts from all the bins gives the number of cells in tissue of 100 um in width. For example, CD123 epi count 1038/2862*100=36.

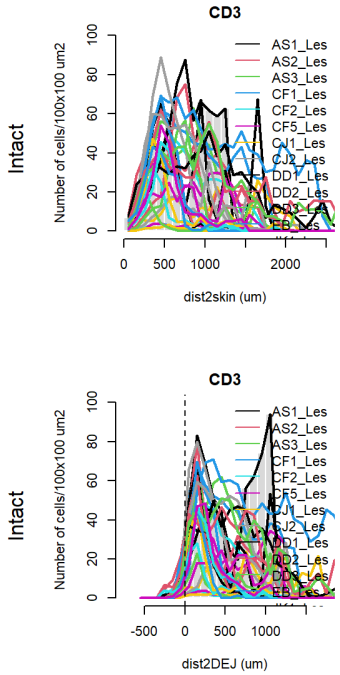

Figure 2: Number of cells per 100x100 um2 tissue as a function of distance to DEJ or skin. The curves are smoothed over histograms and each bin in the histogram represents a 100 um interval. Adding up the counts from all the bins gives the number of cells in tissue of 100 um in width.

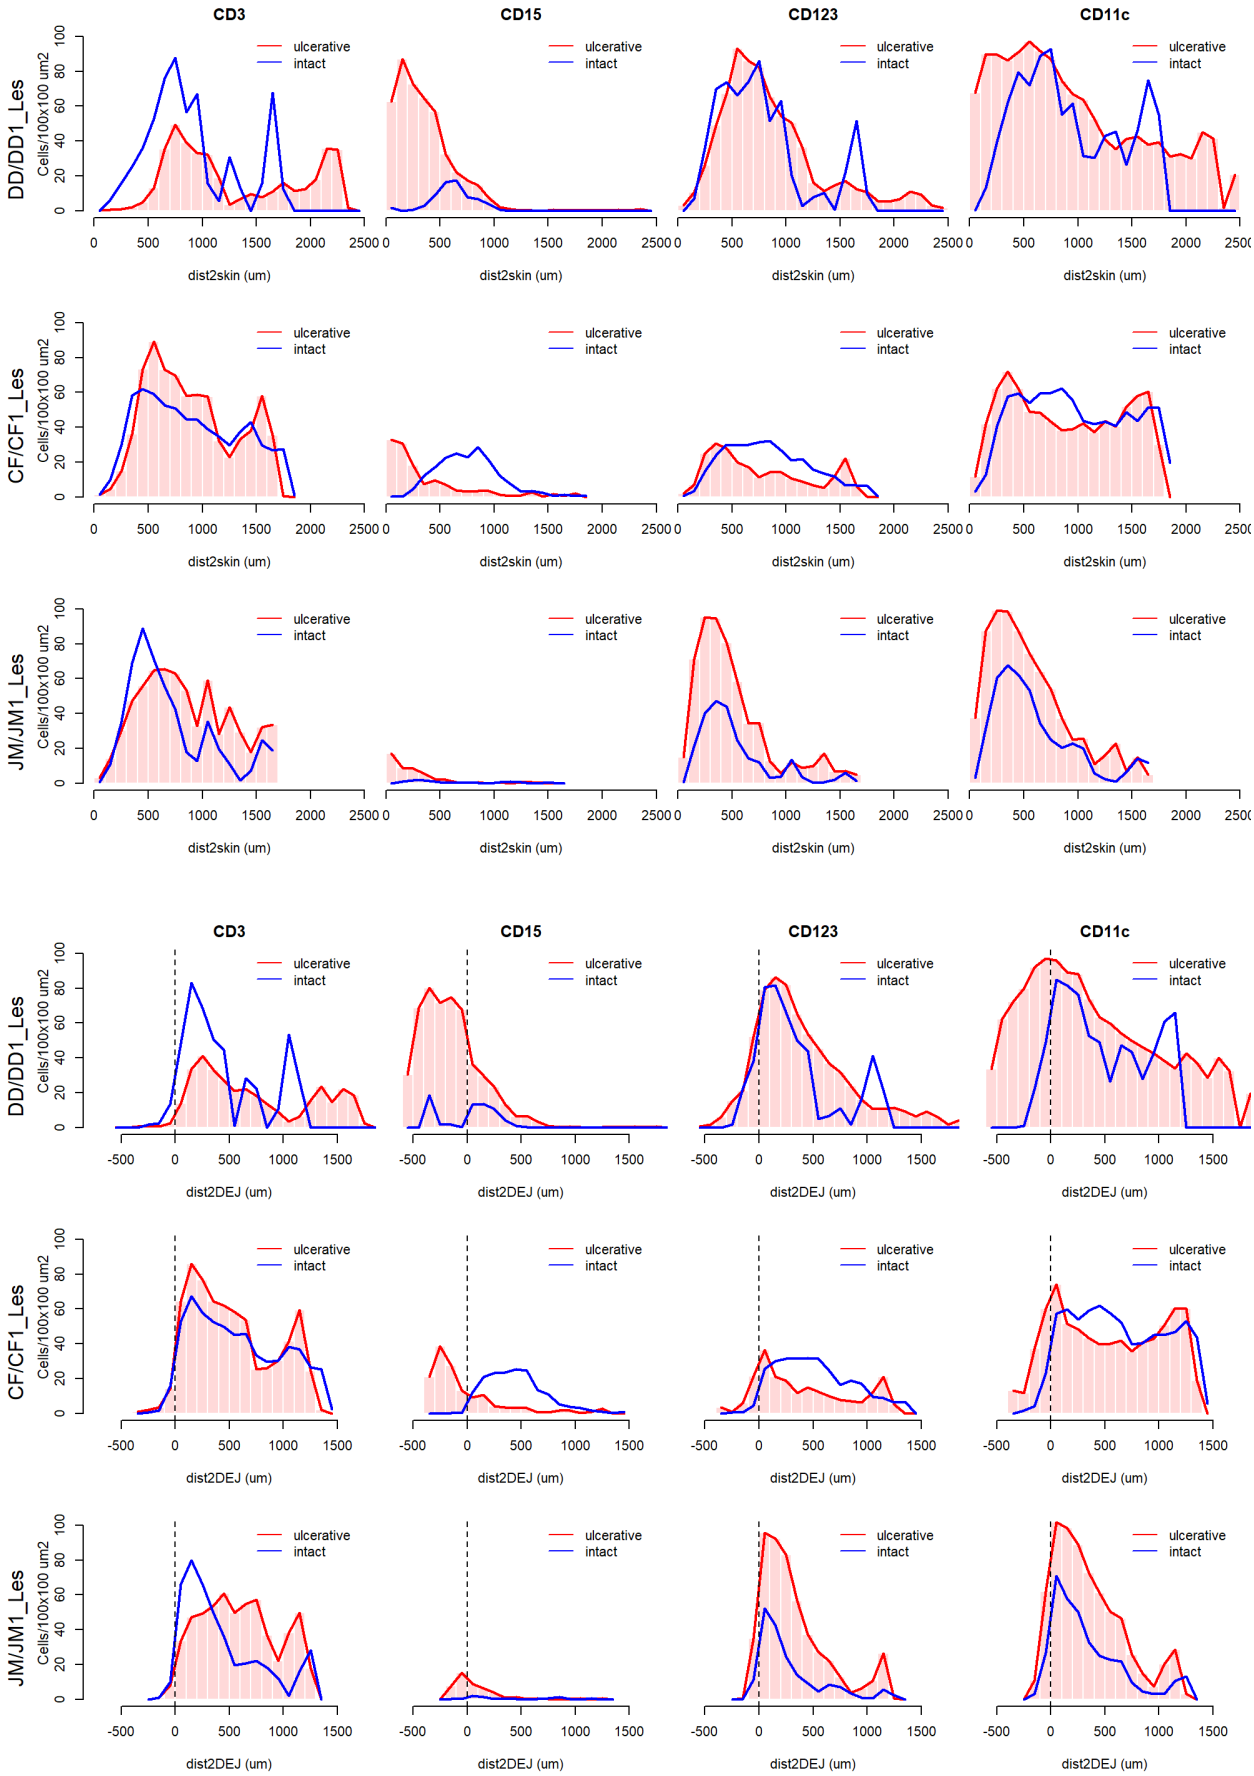

Figure 3: Number of cells per 100x100 um2 tissue as a function of distance to skin or DEJ. The curves are smoothed over histograms and each bin in the histogram represents a 100 um interval. Adding up the counts from all the bins gives the number of cells in tissue of 100 um in width.

Comparing the first two rows in the first column, we see that the ratio of the area under the curve across both epi and dermis between red and blue(ulcerative and intact) is about 1 for CD3/CF and 1/3 for CD3/DD. This suggests that CD3 is depleted in lesion in DD, but not in CF.

Compare lesion with normal in CD15/CF, we see that the lesion peak is shifted to the left compared to the normal peak. This pattern is more clear in CF than in DD. We don't see this pattern for CD3.

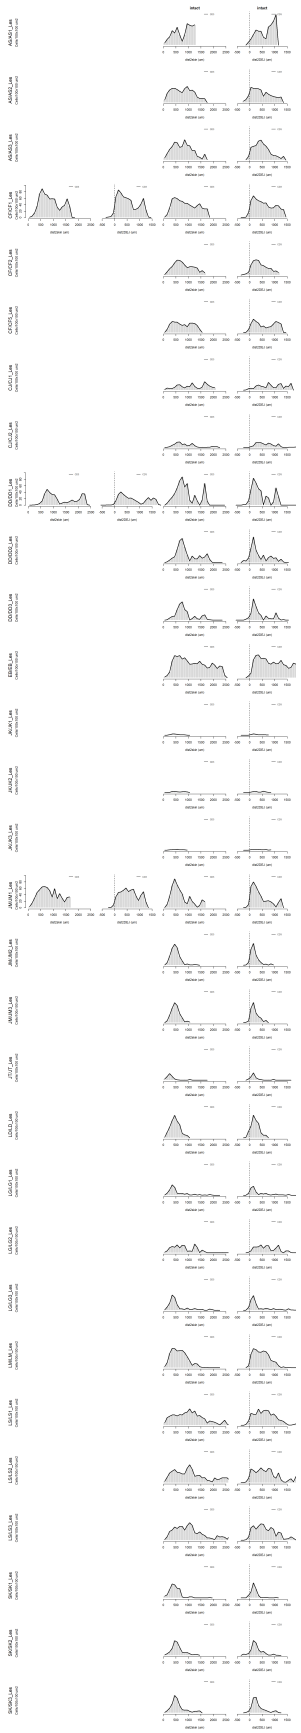

Figure 4: Number of cells per 100x100 um2 tissue as a function of distance to skin. The curves are smoothed over histograms and each bin in the histogram represents a 100 um interval. Adding up the counts from all the bins gives the number of cells in tissue of 100 um in width.

That the CD15 dist2skin peak in DD/lesion is near skin while the corresponding dist2DEJ peak is near DEJ is due to the fact that the DEJ line is very curvy.
