report_32bit

May 21, 2025

Introduction

There are 13 lesion biopsies in total, including AS. Different biopsy samples or even different slices from the same biopsy sample may have different amount of lesion tissues. Some completely lack lesion. List of available markers per slide:

$AS1_Les [1] CD11c CD123 CD15 CD279 CD3 CD4 CD45 CD56 CD68 CD69 CD8 Foxp3 Ki67 CD4T CD8T Treg

Most lesion biopsies have multiple sections. The following choices of representative slides are made:

Select slide	Shedding rate
AS1_Les	83.9
CF1_Les	17.5
CJ1_Les	43.1
DD1_Les	39.4
EB_Les	4.6
JK1_Les	23.4
JM1_Les	24.6
JT_Les	54.3
LD_Les	18.8
LG2_Les	32.8
LM_Les	4.4
LS2_Les	31
SK2_Les	53

The key markers are: CD3 CD11c CD123 CD15 CD56 CD68.

Note that the CD68 antibody stained the epidermis of some tissues. CD68_raw.png is the raw image, and CD68.png is the processed image with reduced epidermis brightness to improve quality of segmentation. Furthermore, for CF lesion CD68 staining, CF5_Les instead of CF1_Les is used due to quality reasons.

Correlation with shedding rate

Based on the previous report, we decided to

- focus on normalized counts
- focus on average across slides and select slides and not all slides, which has low correlation
- focus on these metrics
  - DEJ1000, DI
  - DEJ500, DI
  - skin1000, I
  - skin500, I
  - EI

Notes on methods:

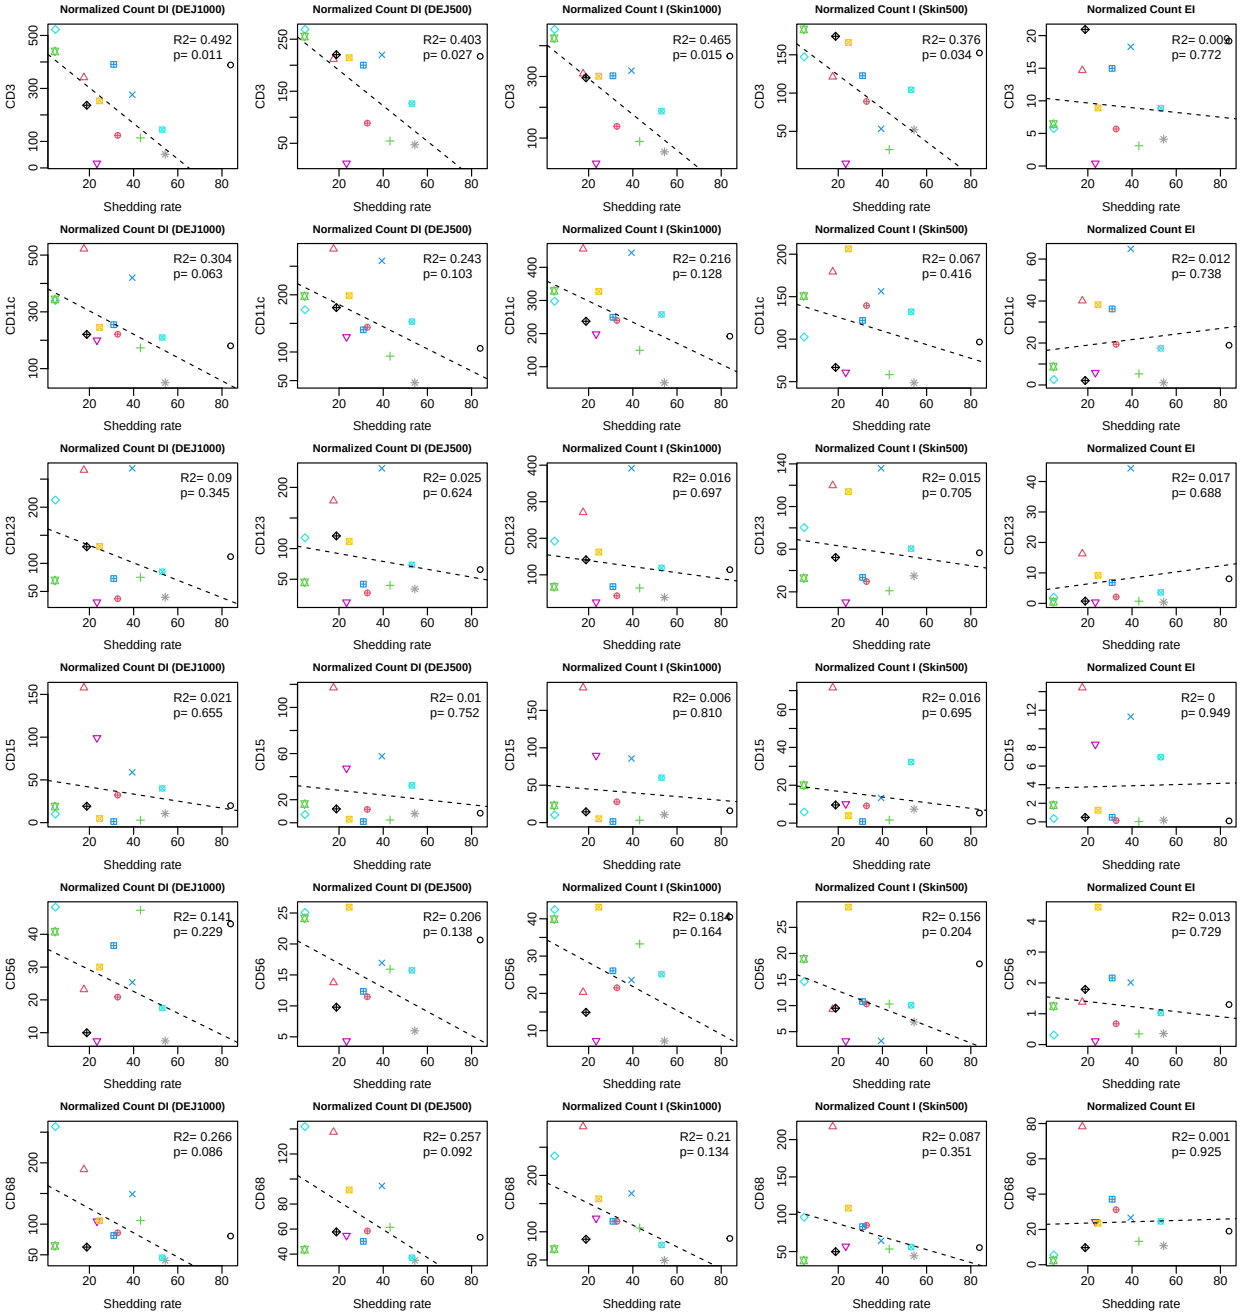
- Density is the number of cells/mm^2. The size of biopsy is on the order of mm^2.
- Depth density function is a function of the number of cells per 100x100 um2 tissue over the distance to skin or DEJ in 100 um increment. Each bin in the histogram represents the count in a 100x100 um2 area.
- Normalized count is the number of cells in a vertical strip 100um wide, and is equivalent to the area under the depth density function (restricted to certain depth if applicable). It is called normalized count because each depth is weighted equally instead of variable depending on the tissue shape.
- Ratio is presented as fraction in tables and percentages in graphs. A gap in depth density ratio function is often due to the denominator being 0.
- R^{2*} is computed without slides from AS_Les, which has the highest shedding rate and appears an outlier.

Notes on results:

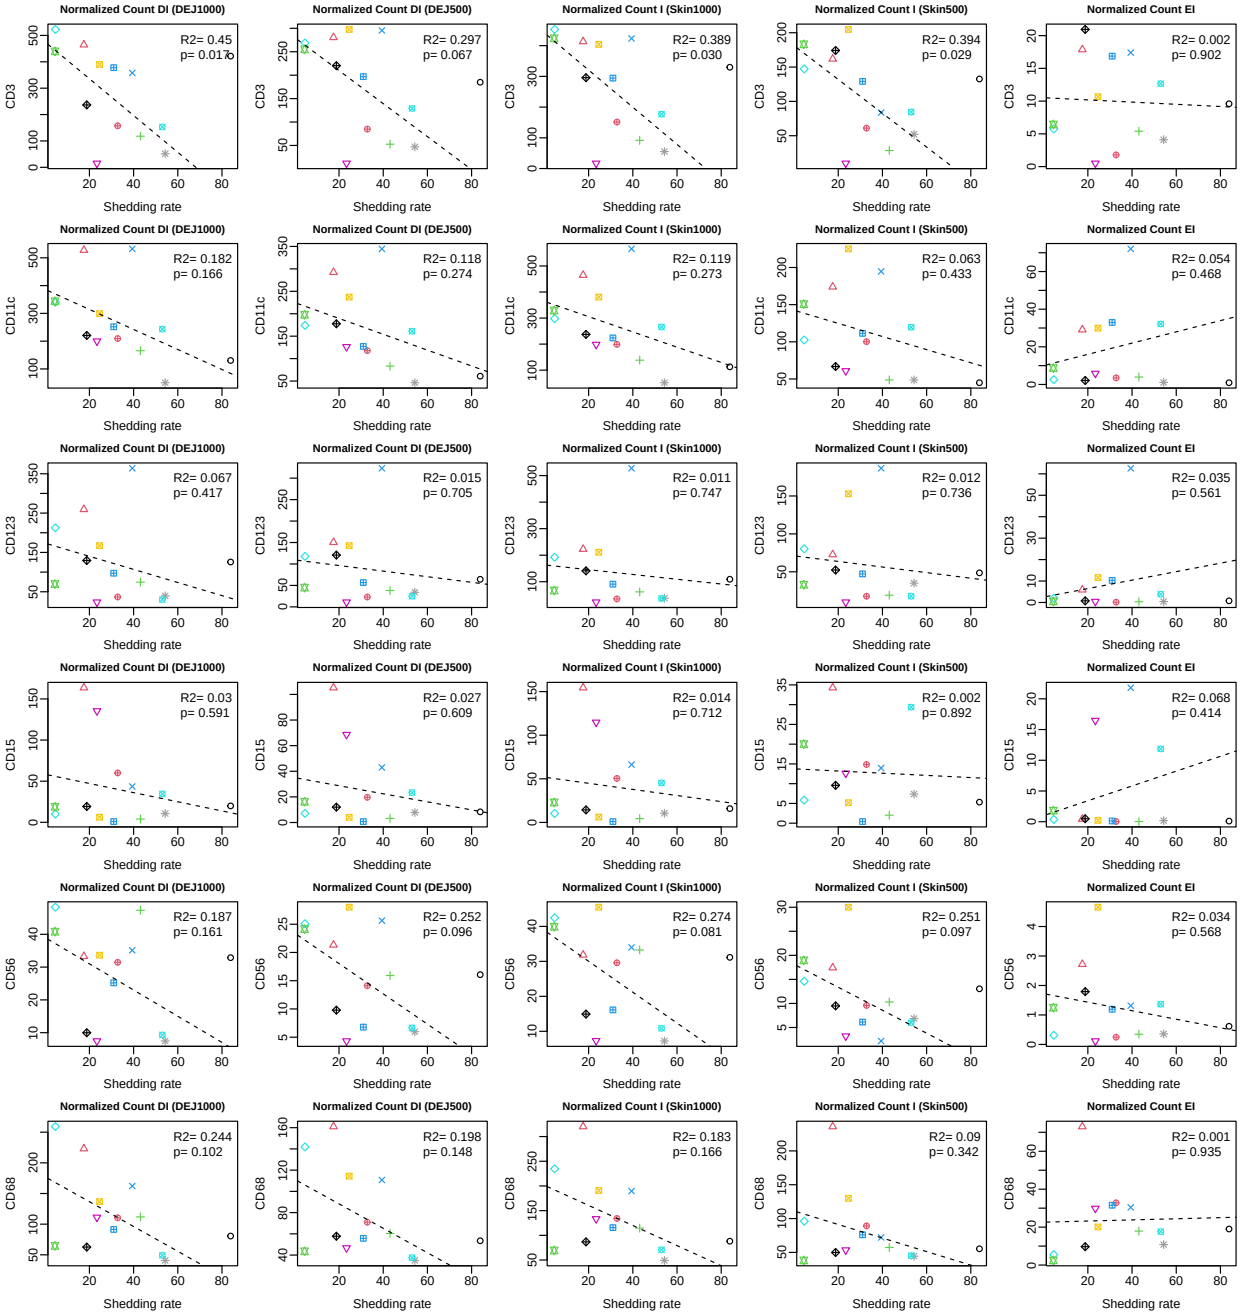
- Treg counts from JK1_Les and JK3_Les are quite different: 19 and 161. This led the R2 for Treg/CD3 in DI to be higher for select slides than for average slides.

Legend for biopsies

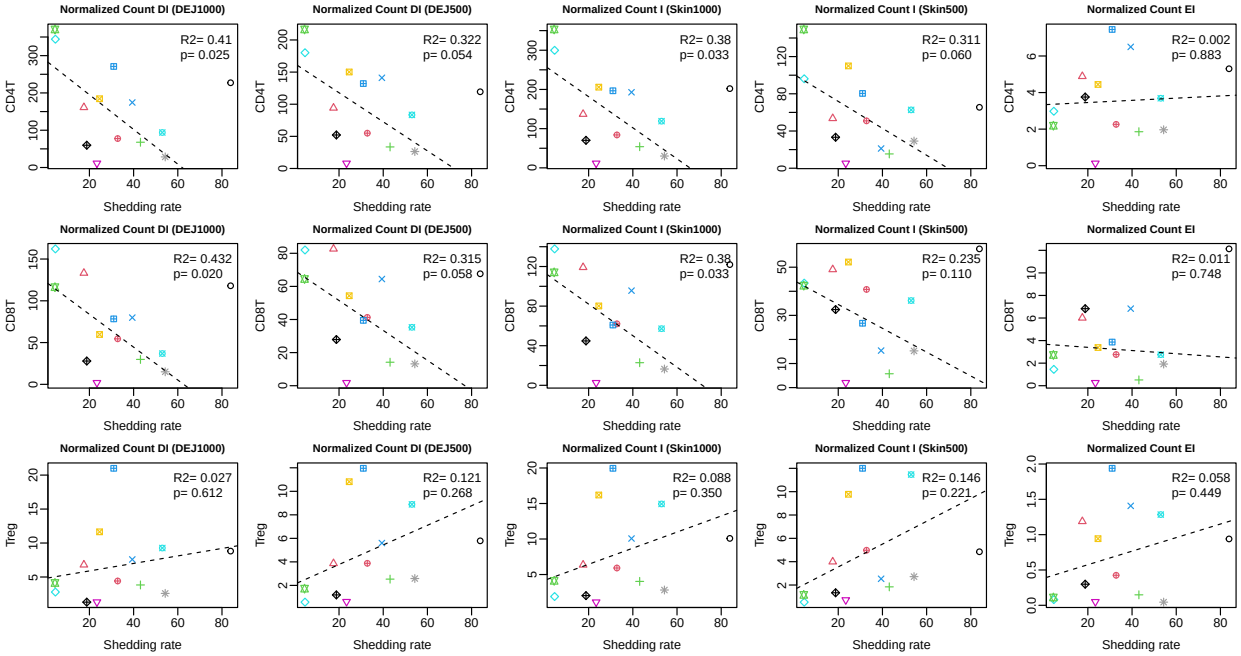
Average Slides. CD3, CD11c, CD123, CD15, CD56, CD68



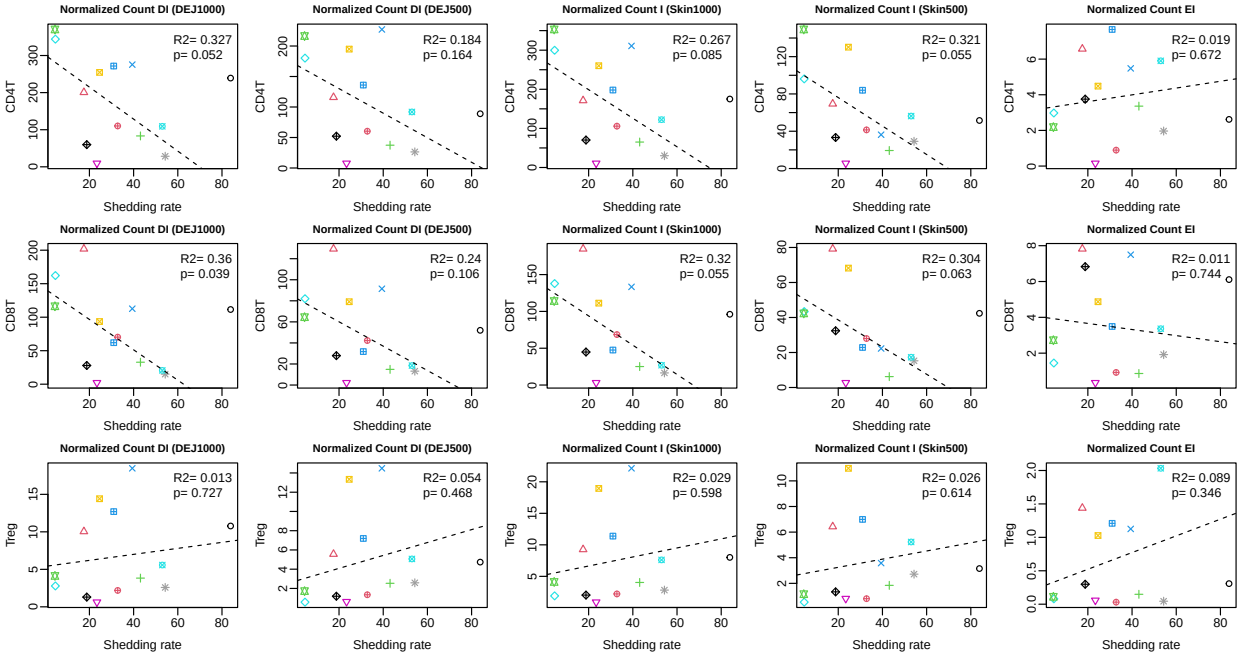
Select Slides. CD3, CD11c, CD123, CD15, CD56, CD68



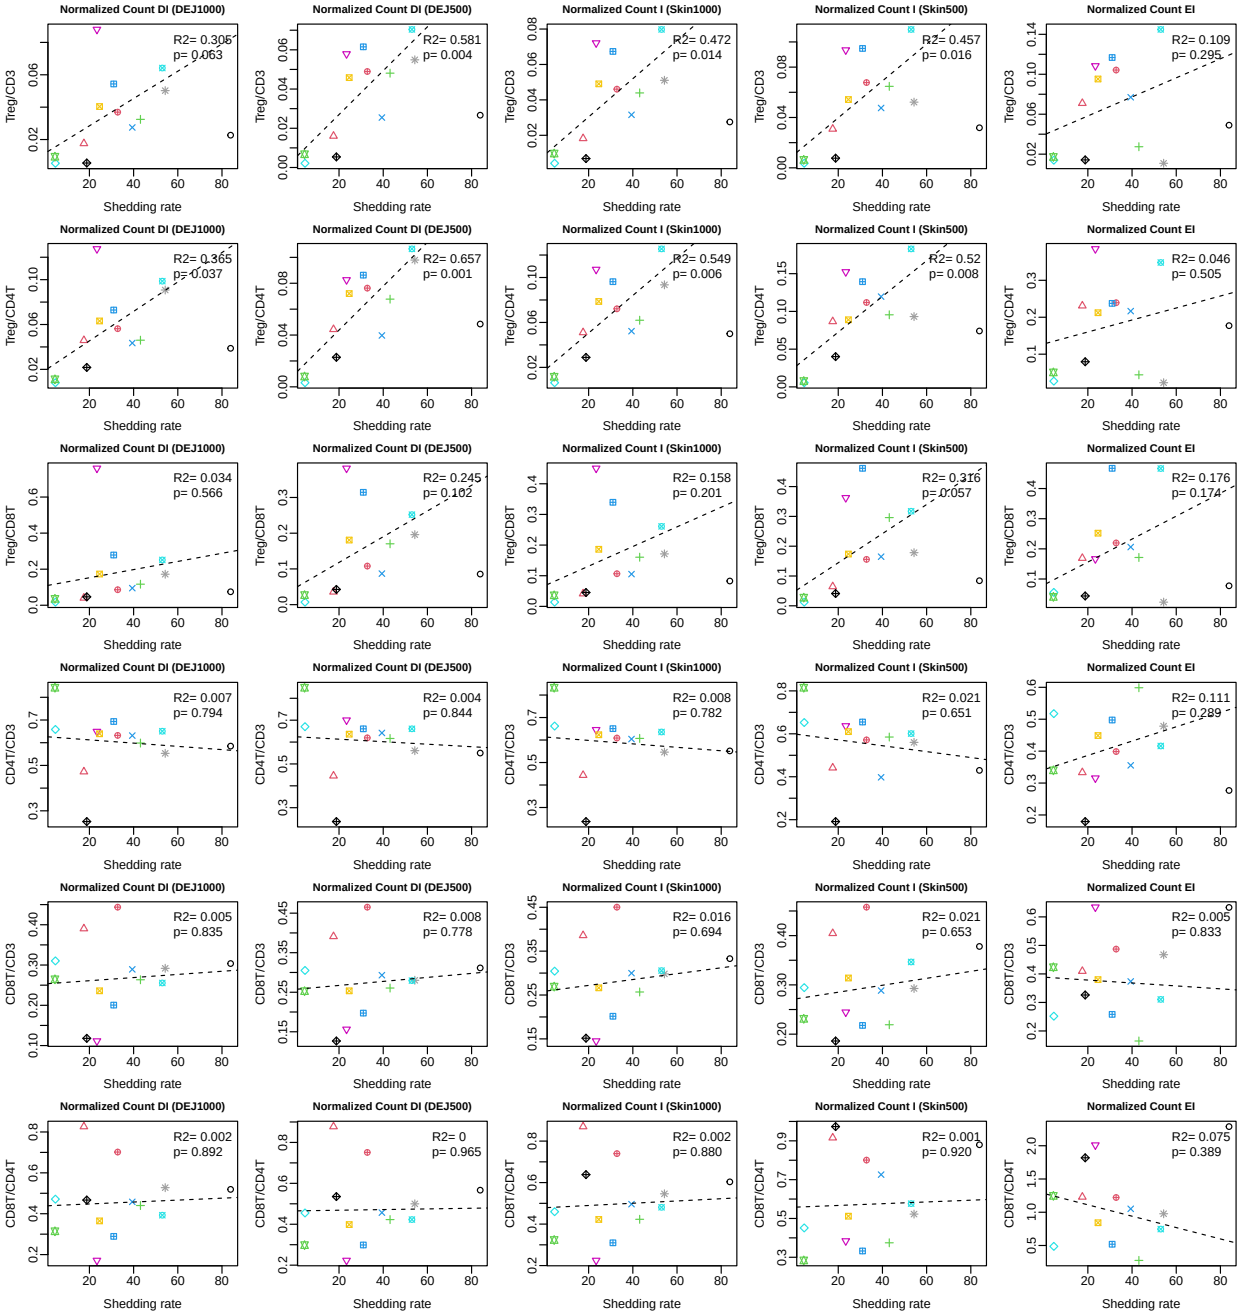
Average Slides. CD4T, CD8T, Treg



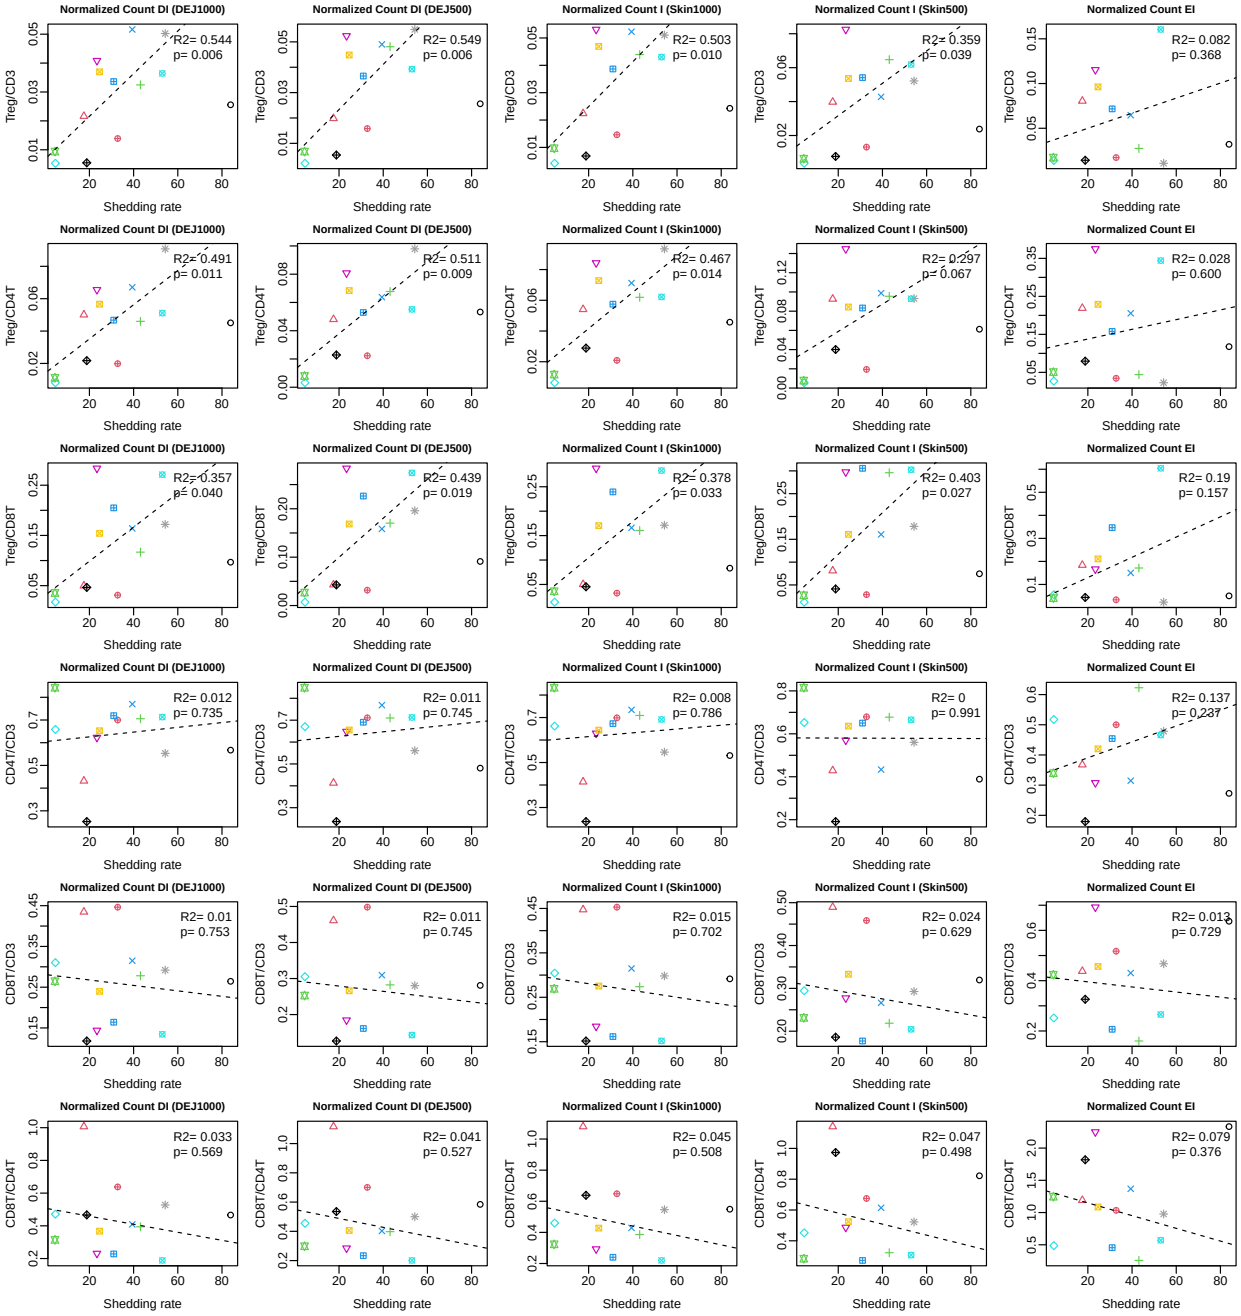
Select Slides. CD4T, CD8T, Treg



Average Slides. Treg/CD3, Treg/CD4T, Treg/CD8T, CD4T/CD3, CD8T/CD3, CD8T/CD4T



Select Slides. Treg/CD3, Treg/CD4T, Treg/CD8T, CD4T/CD3, CD8T/CD3, CD8T/CD4T



Depth density function

Intact vs. ulcerative - representative slides

In this subsection, there are two sets of figures, one for dist2skin and one for dist2DEJ. Each figure shows 13 representative slides.

CD8T/CD3	0.39	0.14										
CD8T/CD4T	0.90	0.23										
Size of biopsy									0.60	2.81		

Table 151: SK3_Les. All measurements are up to 1000 um below DEJ. Size of biopy is measured in mm2; the unit of density is count/mm2. Normalized count is the number of cells in a vertical strip 100um wide. Ratios are presented as fractions, not percentages.
